SANI ALIM

SOFTWARE QA ENGINEER

SOFTWARE QUALITY ASSURANCE PORTFOLIO

Manual Testing • Functional Testing • Usability Evaluation • API Testing

PROFILE
Informatics Engineering graduate with practical experience testing web applications, validating application functionality, evaluating user experience, and testing REST APIs.

PROJECT HIGHLIGHTS

01 Sembako18 – Inventory Management System
02 Company Management Website – Payroll, Employee Management & Attendance
03 PT. Lui Jaya Bersama (Dealkan) – Software Engineering Internship

Institut Informatika Indonesia | Informatics Engineering

PROFILE & TESTING SKILLS

A summary of my testing experience and practical approach.

ABOUT ME

I am an Informatics Engineering graduate with an interest in Software Quality Assurance and software testing. I have experience performing manual testing on web applications, preparing test scenarios, identifying issues, and documenting testing results. My experience includes functional testing, black-box testing, boundary value testing, negative testing, UEQ-based usability evaluation, and REST API testing using Postman.

CORE SKILLS

Area	Skills
Manual testing	Functional testing, black-box testing, positive and negative testing, boundary value testing, feature-by-feature testing, retesting
Usability evaluation	UEQ-based questionnaire evaluation, questionnaire data collection, mean and variance calculation, benchmark comparison

API testing	REST API testing, Postman collections, request and response validation, data synchronization verification
Test documentation	Test scenario preparation, expected vs. actual results, issue reporting, reproduction steps, supporting evidence

MY TESTING WORKFLOW

Step	Activity	Description
01	Requirement analysis	Understand requirements and expected functionality.
02	Test preparation	Define scenarios, steps, and expected results.
03	Test execution	Interact with application features and execute tests.
04	Result documentation	Record actual results and mark tests as Pass or Fail.
05	Issue reporting	Describe unexpected behavior with reproduction steps and evidence.
06	Retesting	Verify whether reported issues have been resolved.
07	Evaluation	Review outcomes and identify potential improvements.

PROJECT 01 | SEMBAKO18

Inventory Management System

PROJECT OVERVIEW

Sembako18 is an academic software project focused on inventory management. The application provides inventory-related functionality and supports data processing for inventory operations.

MY QA CONTRIBUTIONS

Manual functional testing

- Personally performed manual testing on individual application features.
- Prepared and executed test scenarios to verify application functionality.
- Compared actual application behavior against expected results.
- Performed positive and negative testing to identify unexpected behavior.
- Tested boundary conditions to evaluate how the system handled different input limits.
- Checked database transaction integrity to ensure data operations were processed correctly.
- Identified potential defects and areas requiring improvement.

Acceptance-oriented functional validation

- Evaluated application functionality against its intended requirements.
- Verified whether individual features fulfilled their expected purposes.
- Documented testing observations and identified functionality requiring further improvement.

> **Scope clarification:** Functional validation was personally executed by me. This is not presented as a formal multi-user UAT session.

KEY LEARNING OUTCOMES

Developed practical experience validating application behavior, checking edge cases, and assessing whether individual features meet their intended requirements.

SEMBAKO18 | UEQ-BASED USABILITY EVALUATION

Questionnaire-based evaluation of the website's perceived user experience.

METHODOLOGY

I conducted a questionnaire-based usability evaluation using a 26-question Indonesian-language questionnaire adapted from the User Experience Questionnaire (UEQ) approach. Participants were asked to try the website through a guided demonstration before evaluating their experience. Approximately 11–20 respondents participated, including myself and other participants.

My contributions included preparing the questionnaire, collecting responses, processing the data, calculating mean and variance values for six dimensions, and comparing the mean scores against UEQ benchmark categories.

THE SIX EVALUATION DIMENSIONS

Dimension	Evaluation focus
Attractiveness	Overall impression and appeal of the application
Perspicuity	How easily users understand and learn the application
Efficiency	How efficiently users can complete tasks
Dependability	Perceived control, predictability, and security
Stimulation	How interesting and motivating the application feels
Novelty	Perceived creativity and innovation

MEAN SCORES

UEQ dimension	Mean score
Attractiveness	2.043
Perspicuity	1.350
Efficiency	2.150
Dependability	1.607
Stimulation	1.964
Novelty	1.571

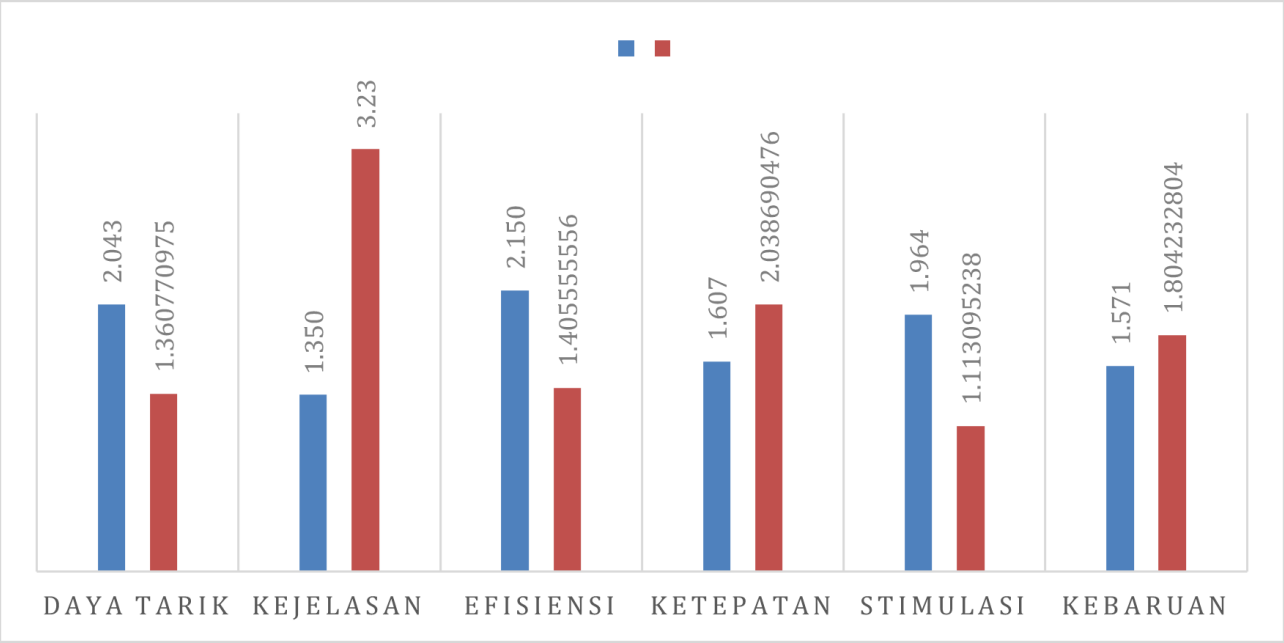

The mean scores are presented as calculated in the project analysis. The questionnaire was adapted into Indonesian, so the results are described as UEQ-based rather than as an unmodified standardized UEQ administration.

SEMBAKO18 | UEQ RESULTS & INTERPRETATION

Visualizations from the questionnaire analysis.

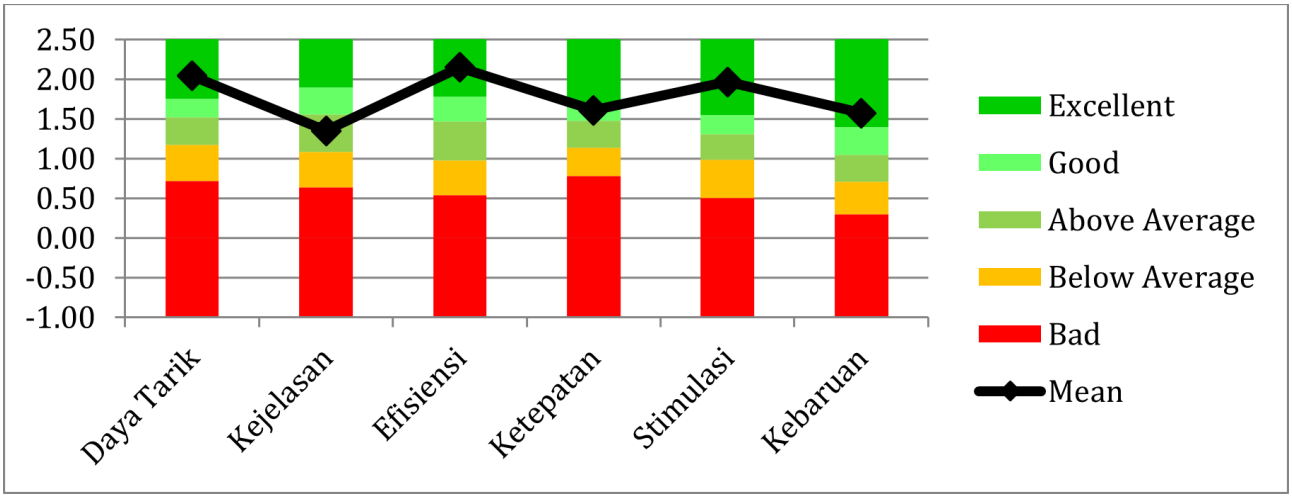

1. MEAN AND VARIANCE COMPARISON

This chart compares the mean score and variance for each of the six evaluation dimensions. Mean represents the average response score, while variance describes how spread out the responses are.

2. UEQ BENCHMARK COMPARISON

This chart compares the six mean scores against the benchmark categories shown in the project analysis: Bad, Below Average, Above Average, Good, and Excellent.

KEY FINDINGS

- Efficiency achieved the highest mean score (2.150).
- Attractiveness (2.043) and Stimulation (1.964) also received relatively high mean scores.
- Perspicuity had the lowest mean score (1.350).
- Perspicuity also had the highest variance (approximately 3.230), indicating greater variation in respondents' answers forthis dimension.

These findings suggest that efficiency and overall appeal were perceived positively, while ease of understanding and learning may require further improvement. Variance indicates response spread; it does not independently indicate whether a dimension is good or bad.

PROJECT 02 | COMPANY MANAGEMENT WEBSITE

Payroll, Employee Management & Attendance

PROJECT OVERVIEW

A web-based company management system developed to support employee management, payroll processing, and attendance management.

MY QA CONTRIBUTIONS

- Performed manual testing on individual application features.
- Verified that each feature behaved according to its intended functionality.
- Checked input forms, data submissions, and application responses.
- Tested different user interactions and scenarios to identify unexpected behavior.
- Validated data displayed and processed by different application modules.
- Prepared test scenarios to organize the testing process.

TESTING AREAS

Module	Testing focus
Employee Management	Employee data input and management
Payroll	Payroll-related functionality and calculations
Attendance	Attendance recording and management
Form Validation	Required fields and input handling
Feature Validation	Expected behavior of individual features

KEY LEARNING OUTCOMES

Gained practical experience testing a multi-module business application and understanding the importance of validating individual features and data processing workflows.

PROJECT 03 | PT. LUI JAYA BERSAMA (DEALKAN)

Software Engineering Internship

PROJECT OVERVIEW

During my Software Engineering internship at PT. Lui Jaya Bersama (Dealkan), I participated in software testing activities involving application services and data synchronization between mobile services and a web portal.

MY QA CONTRIBUTIONS

- Performed REST API testing using Postman.
- Created and organized API test collections.
- Verified API requests and responses.
- Checked data consistency between mobile services and the web portal.• Reported issues with clear reproduction steps and supporting evidence.
- Retested reported issues after fixes to verify whether the problems had been resolved.

KEY LEARNING OUTCOMES

Developed practical experience with API testing, data validation, issue documentation, and understanding how different application components communicate.

PROFESSIONAL SUMMARY

What I bring to a Software QA Engineer role.

My project experience has provided me with a foundation in manual testing, API validation, usability evaluation, and software issue documentation. I have worked with both individual application features and interconnected modules, and I understand the importance of checking expected behavior, data consistency, and user experience.

I am continuously developing my knowledge and practical skills in Software Quality Assurance. I am eager to expand my technical knowledge, learn new testing methodologies, and contribute to delivering reliable, functional, and user-friendly software.
